23. A multiple display supporting module comprises:  
a processing module; and  
memory operably coupled to the processing module, wherein the memory includes operational instructions that cause the processing module to execute the steps of  
(a) receiving capability parameters for each display of the multiple displays;  
(b) determining selected display capabilities based on the capability parameters of each display of the multiple displays, the selected display capabilities exceeding each of the multiple displays;  
(c) substituting the selected display capabilities for the capability parameters of a respective display of the multiple displays; and  
(d) providing the selected display capabilities to an operating system.
